WARNING: nixies need high voltage to light up. If you choose to build the calculator, you are doing so at your own risk.

Please read all the documents in Docs first.

BOM/Components

I have tried to use available and modern components but currently some of the IC's have long lead times. That seems to be a common problem these days.

Power supply

The calculator needs a **stabilized** 12V DC 2A center positive power supply.

Optional peripherals

You can connect a GPS module with U-Blox chip, a PIR and a DS18B20+ temperature sensor. All the peripherals must work with 5V input voltage and 3.3V logic. The pictures show the all-in-one solution I designed for this project.
