Keyboard layout

For this project we need some custom Cherry MX keycaps. The picture shows the keyboard layout and the keycap type (Row1 – Row4). All keycaps are 1x1.

Classic

You can order some blank keycaps and print your own legends, for example using sublimation ink, sublimation paper and an inkjet printer. You can also order custom keycaps from a service provider.

I've used Inkscape to modify the 104-key template file (V6.0) provided by WASD Keyboards. I cannot provide the template file but in the svg file you can see the legends layer I have designed for my keyboard.

If you decide to use my design as a starting point, you can try this:

- Download the 104-key template file for Inkscape from the support area
- Open the template with Inkscape and hide the "message" layer
- Add a new layer called "Nixie Calculator" and make sure it's selected, visible and unlocked
- Open another instance of Inkscape
- Open the "Keycaps/Nixie_Calculator_extended.svg" file
- Select all legends (ctrl-a). Make a note of the X and Y coordinates of the selection
- Copy the legends (ctrl-c)
- Go to the instance with the template file
- Paste the legends (ctrl-v)
- Bring the legends into position by setting the X and Y coordinates to the previously noted values. Now you can modify the legends as you wish. Check that everything is correctly aligned.
- **Important: set the desired legend colors**. If you want white legends as shown in the picture, you must set the text color to white.
- Unhide the "message" layer and **carefully read and follow the instructions shown in the template before placing your order.**

I can think of two options:

- Classic mode:
  F -> clock mode and settings
  AC -> all clear
  C -> clear last

- Alternate mode:
  F -> shift (second level of functions)
  🕐 -> clock mode and settings
  C -> all clear

Alternate

If you want to use the alternate mode, it is also possible to add a second level of functions to the keycap legends. For example, something like this:
